

Equipment coming soon to the SN Machinery Range of Quality Products

KD1

Rotary Piston Doser, usually applied for the dosing of coarse-grained and granule-like products (coffee, sugar, rice, beans and peas).

WEM

The roller equalization unit is made for a homogeneous distribution of powder products and granules into flat pouches in order to pile them properly.

In the first step the product is prepared as homogeneous as possible in order to distribute it equally in the bags. The device can be easily adjusted to various bag sizes.

The vibration and the speed of the belt can be individually controlled and can be therefore adjusted to nearly all sorts of product.

SAL

The piling device is designed for collection of bag groups which can be individually adjusted and for the transport into continuing conveying systems.

The core of a piling device is a free-programmable control unit for processing the diverse signals necessary for the synchronising to the machine.
